

Self Driving Cloud

Troubleshooter

Lead UX Designer

Role

I was the **first designer** to join the Self Driving Cloud team and ever since, I've been the **Lead UX Designer** and **thought leader** behind the suite of SDC products three years now.

Troubleshooter is the **second product** within the self-driving cloud initiative that I have lead from inception to launch.

The Problem Statement:

Troubleshooting 403 error messages is hard.

It's done through lots of trial & error.

**Admins troubleshoot
by giving *more*
permissions, which
makes it hard to
maintain least
privilege.**

What are we building?

Troubleshooter is the **second product launch** within the Self Driving Cloud suite of products. This product is meant to help over granting permissions by helping admins debug denial error messages.

Built on the IAM Recommender API, it was a sophisticated backend that needed to be unpacked simply in the UI.

Example User Scenario

Anita is a developer in your organization and gets an error message informing her that she does *not* have the relevant permissions when she tries to delete images in a bucket.

Anita goes to Mike, her security admin for help, who has to manually check the policy himself, and will end up expediting the process by just granting Anita a bunch of unnecessary roles.

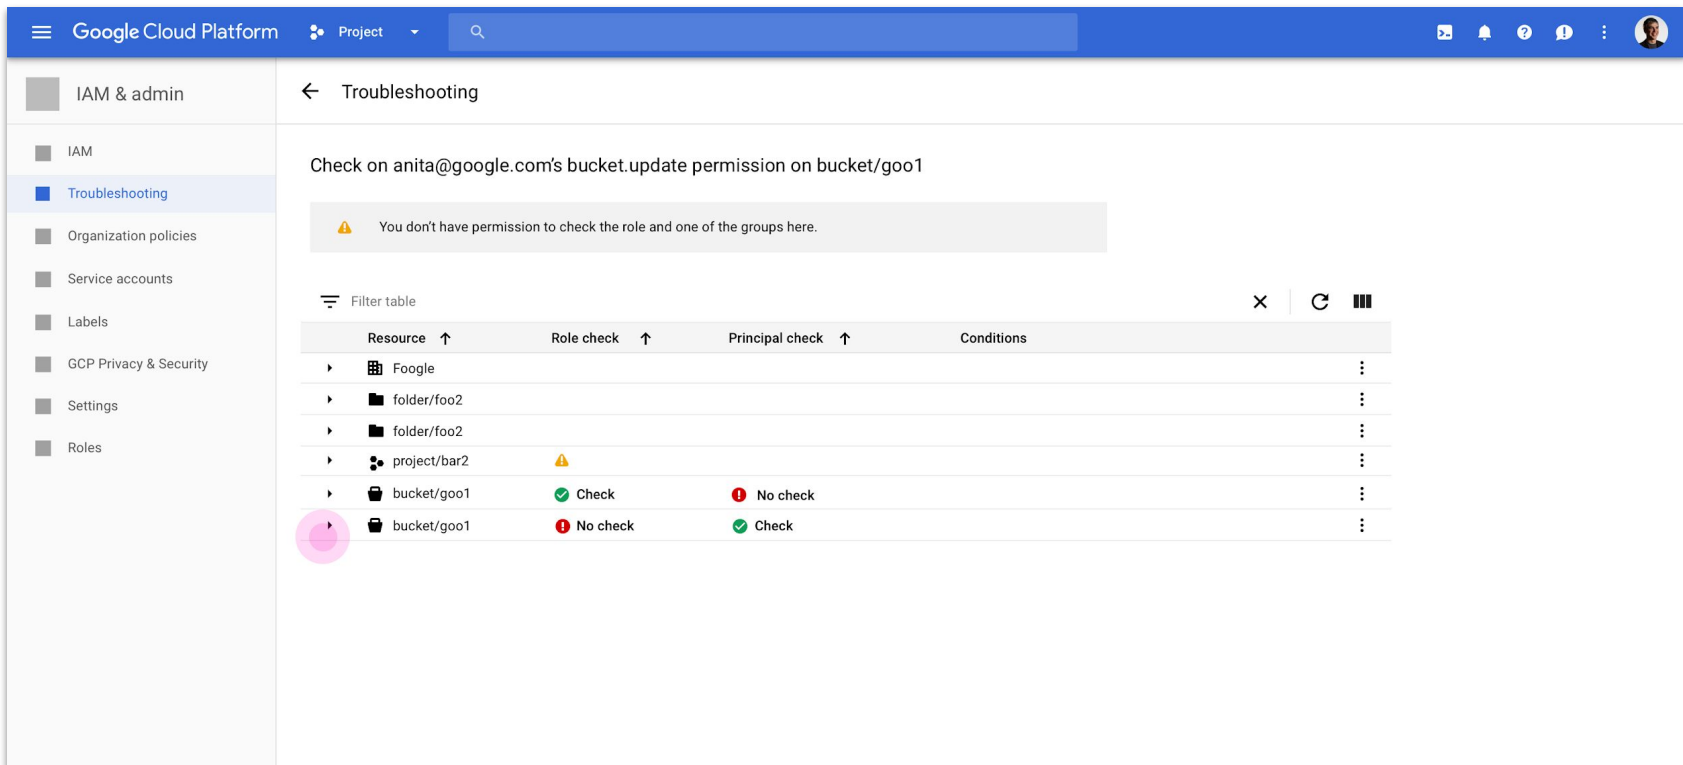

Translating the API to GUI

The engineers had approached me with a predetermined sketch in mind.

After going through many rounds of the engineers' design solution, I was convinced that their way was not the way to go. Through lots of research, I changed product direction by designing a different way to display IAM bindings by showing raw json policy so that advanced users would be able to click through bindings via a tree hierarchy.

I was able to change product direction with multiple stakeholders with design thinking and creating a more visual tool for developers.

...FYI, here was the engineer's idea

Google Cloud Platform

Project

← Troubleshooting

Check on anita@google.com's bucket.update permission on bucket/goo1

⚠ You don't have permission to check the role and one of the groups here.

Filter table

Resource ↑	Role check ↑	Principal check ↑	Conditions
▶ Foogle			⋮
▶ folder/foo2			⋮
▶ folder/foo2			⋮
▶ project/bar2	⚠		⋮
▶ bucket/goo1	✅ Check	❌ No check	⋮
▶ bucket/goo1	❌ No check	✅ Check	⋮

...another example.

GRANT ACCESS

No matter how many **versions of tables** I designed, the **problem was that developers** still couldn't understand and **debug readable text.**

```
{
  "bindings": [
    {
      "members": [
        "user:jie@example.com"
      ],
      "role": "roles/resourcemanager.organizationAdmin"
    },
    {
      "members": [
        "user:divya@example.com",
        "user:jie@example.com"
      ],
      "role": "roles/resourcemanager.projectCreator"
    }
  ],
  "etag": "BwUjMhCsNvY=",
  "version": 1
}
```

Research

Research had shown that the original idea behind the engineer's mocks for the product had one consistent theme:

Nobody could tell that each row in the table represented a binding within an IAM policy.

So, I literally went through the API and the subsequent raw json policy and began scrubbing it, in an attempt to find UI components that would explicitly show what each section of the policy meant.

I decided to be as **explicit as possible** and **expose raw json policy**, just like how developers see it today.

I took a look at some of the most competitive products on the market and **understood a rising trend in policy-as-code**.

I decided to **mimic the policy-as-code** trend as best as I could, while understanding the **constraints of the API**.

We couldn't provide a way to version control policy, but we **could** provide a way for customers to integrate with **3rd party tools** that will allow them to.

```
{
  "bindings": [
    {
      "members": [
        "user:jie@example.com"
      ],
      "role": "roles/resourcemanager.organizationAdmin"
    },
    {
      "members": [
        "user:divya@example.com",
        "user:jie@example.com"
      ],
      "role": "roles/resourcemanager.projectCreator"
    }
  ],
  "etag": "BwUjMhCsNvY=",
  "version": 1
}
```

A preview of the end solution I designed.

The screenshot displays the Google Cloud Platform IAM & admin console. The left sidebar shows the navigation menu with 'IAM & admin' selected. The main content area is titled '11 bindings are affecting bucket/goog throughout the resource hierarchy'. It lists several policies, including 'dev's policy (3)', 'dev-SFO's policy (3)', 'demo's policy (2)', and 'goo's policy (1)'. The 'dev's policy' is expanded, showing three bindings: 'Owner role binding', 'Security role binding', and 'Editor role binding'. The 'Security role binding' is highlighted, showing a condition that is not in the role. The right pane displays the JSON policy for 'dev's policy', which includes bindings for 'roles/owner', 'roles/security', and 'roles/editor'. The 'roles/security' binding has a condition that is not in the role. The 'roles/editor' binding has a condition that is not in the role. The console also shows a message about access granted if the condition is true for API call for anita@foogle.com, bucket.delete, bucket/goog. A 'CONTACT SUPPORT' link is available.

24      }
25    }
26  ]
27  "etag": "123457"
28 }
```

Research 2.0

My researcher ran with my idea of exposing raw json (something that **hadn't been done before within GCP**), and we **ran lots of customer sessions**, often times changing up the **design on the spot**.

The **PM of Troubleshooter** was impressed by the amount of praise the new UI was getting from customers, and began to take the idea of exposing the raw policy and **reusing** the pattern in other areas of self driving cloud.

Expert interface. Looks just like an API response.

Customer on GCP
Name and Company redacted

(I swear they said this).

Now, let's walk through the whole product from **start to finish**.

within GCP, making close to a
[redacted #] API calls a month.

Key Takeaways & Reflections

As the **Lead Designer** (and *only* designer) to ship a second **self driving cloud** product...

1

Accessibility

Since this is highly visual tool that really (and literally) highlights areas that helps developers debug 403 messages, in a mad rush to ship, I had forgotten the most *foundational* part of shipping any visual tool: accessibility.

I hadn't taken into account those who were colorblind.

2

Accessibility

I knew my mistake immediately after we shipped.

Unlike role recommender which had the traditional +/- pattern, (which by the way, is the standard way for those who are colorblind to go through a code diff), Troubleshooter didn't have that pattern.

3

Accessibility

I knew that icons were needed, along with a hidden tag within each icon that would describe what each denial message meant.

I deeply regretted this error, and as someone who prides myself on being an inclusive designer, I knew I had excluded a large portion of users..

Though I talk a lot about inclusivity in design, I hadn't even **held myself accountable**, and had prioritized **shipping > doing right by the user**. It ended up creating tech debt to fix the problem.

I will do **much, *much* better** next time.

As we all should.

Thank You
